# Image Assessor Data-Type Example: Radiology Read

## Research Radiological Assessment

XNATDemo\_E00037\_RAD\_1277750461318 / 000002\_RAD\_1277750461318

<b>Subject:</b>	TOSHIBA_TARO
<b>Date of Birth:</b>	
<b>Age at Scan:</b>	--
<b>Cohort:</b>	
<b>Session Id:</b>	000002
<b>Date of scan:</b>	
<b>Type:</b>	
<b>Scanner:</b>	000000000
<b>Date of assessment:</b>	2010-06-28
<b>Reader:</b>	A. Admin
<b>Exam:</b>	Brain with contrast
<b>History:</b>	
<b>Technique:</b>	
<b>Comparison:</b>	
<b>Finding:</b>	There are scattered nonspecific subcortical white matter changes in both cerebral hemispheres. The white matter changes comprise less than 25% of the total white matter volume.
<b>Diagnosis/Impression:</b>	Minor nonspecific subcortical white matter changes
<b>Status:</b>	
<b>Recommend Further Evaluation:</b>	false

# Where to Store New XSDs

- projects
  - xnat
    - src
      - schemas
        - imgassr
          - imgassr.xsd
        - iq
          - iq.xsd

# Benefits of extending `subjectAssessorData` or `imageAssessorData`

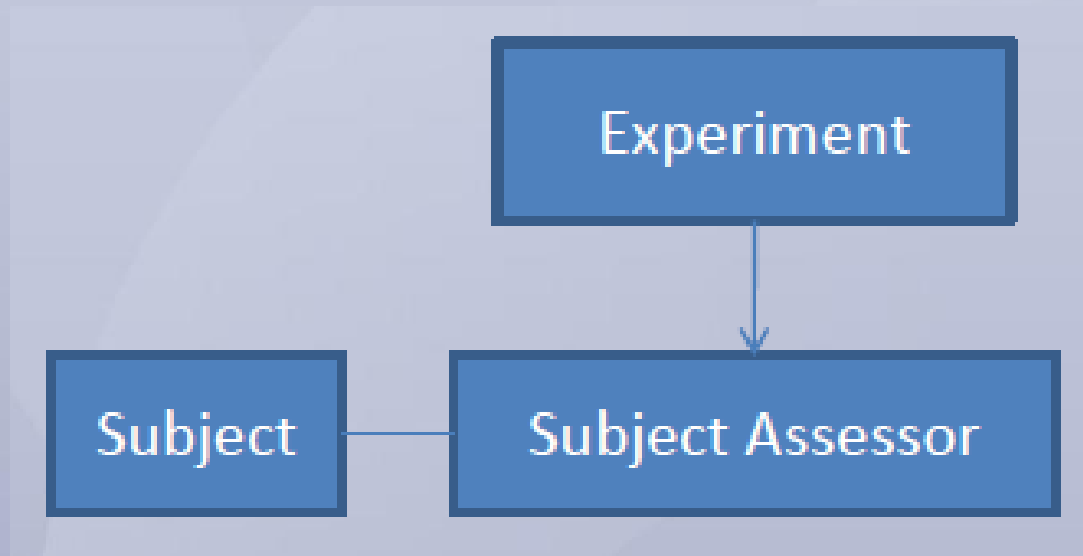

1. Template for your data-type
2. Automatic generation through the update process of edit and report screens, display documents (to help with search) and a helper Java screen class.
3. Data type automatically accessible through REST API
4. Easier to get support from XNAT group

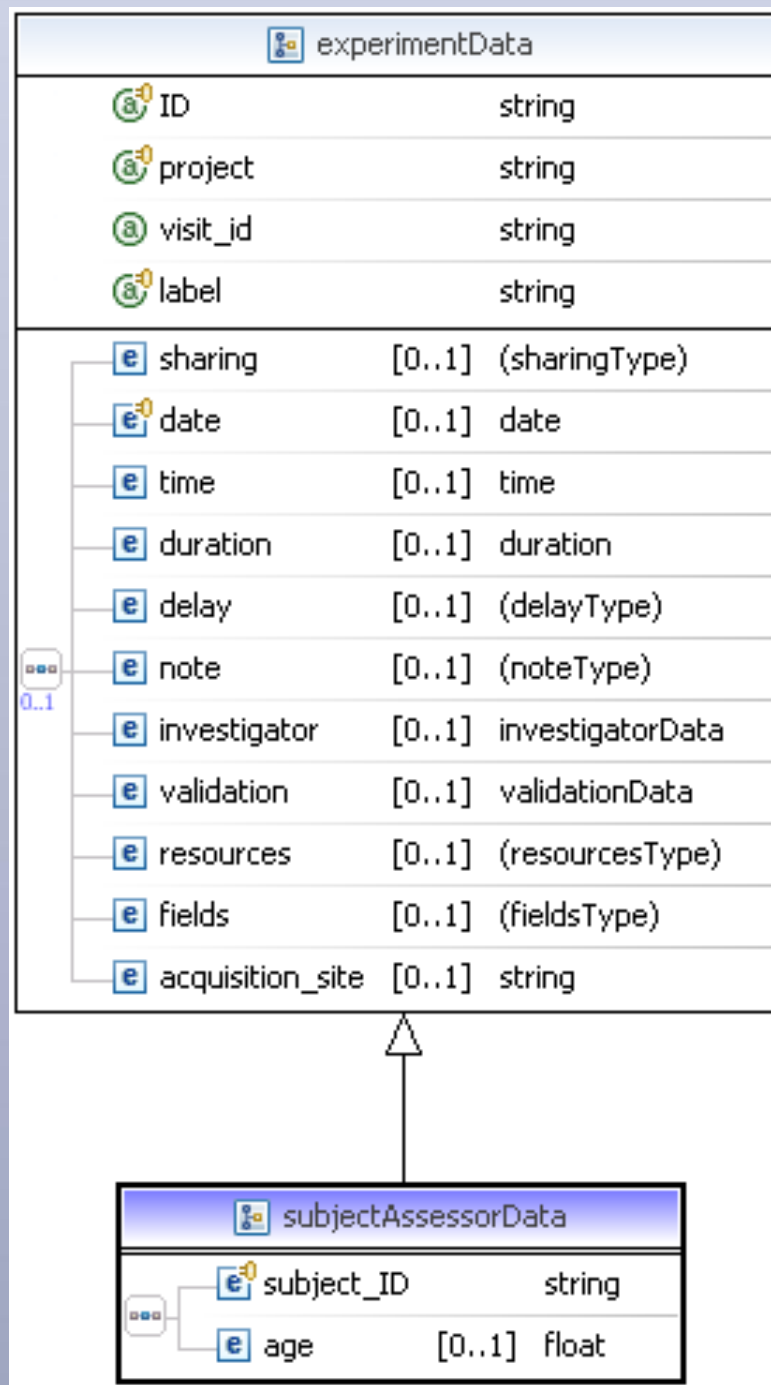

# Extending the subjectAssessorData or imageAssessorData

1. Choose a namespace
2. Create a new XSD file for the new namespace, under the projects directory (if necessary)
3. Define the type extending subjectAssessorData or imageAssessorData
4. Create global/root element for your new type

# Extending the Subject Assessor

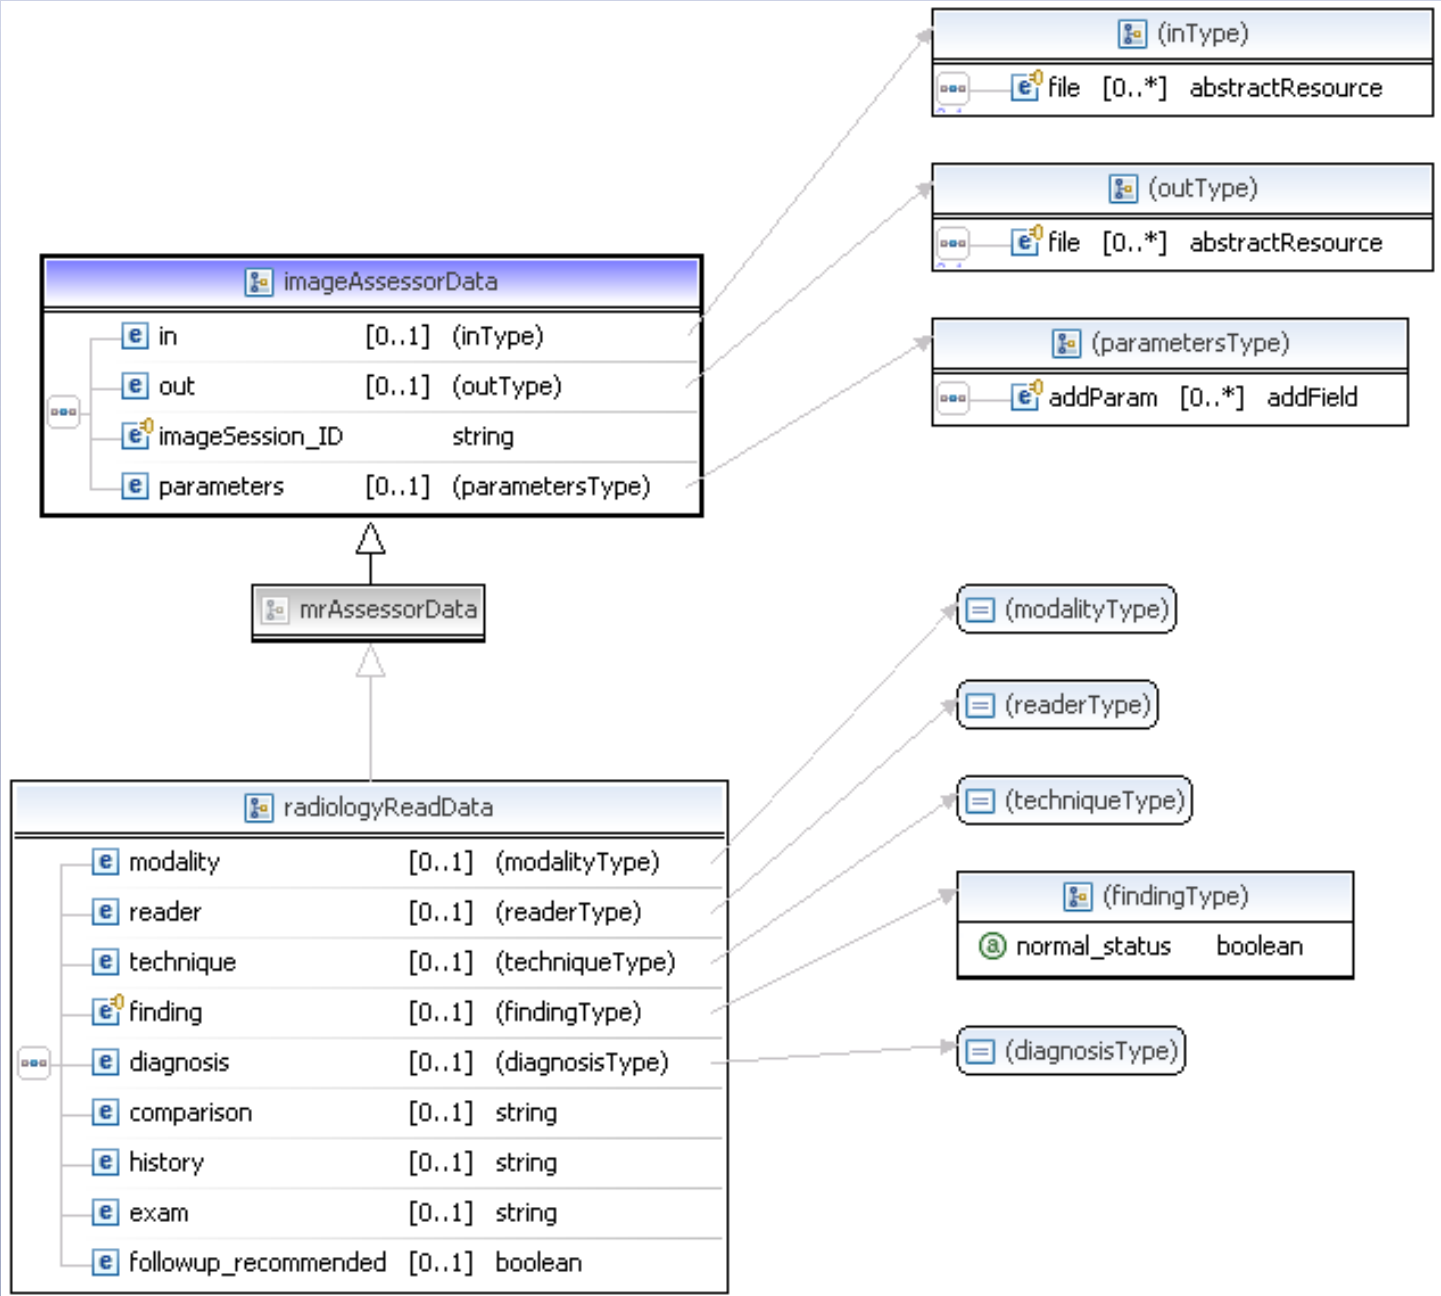

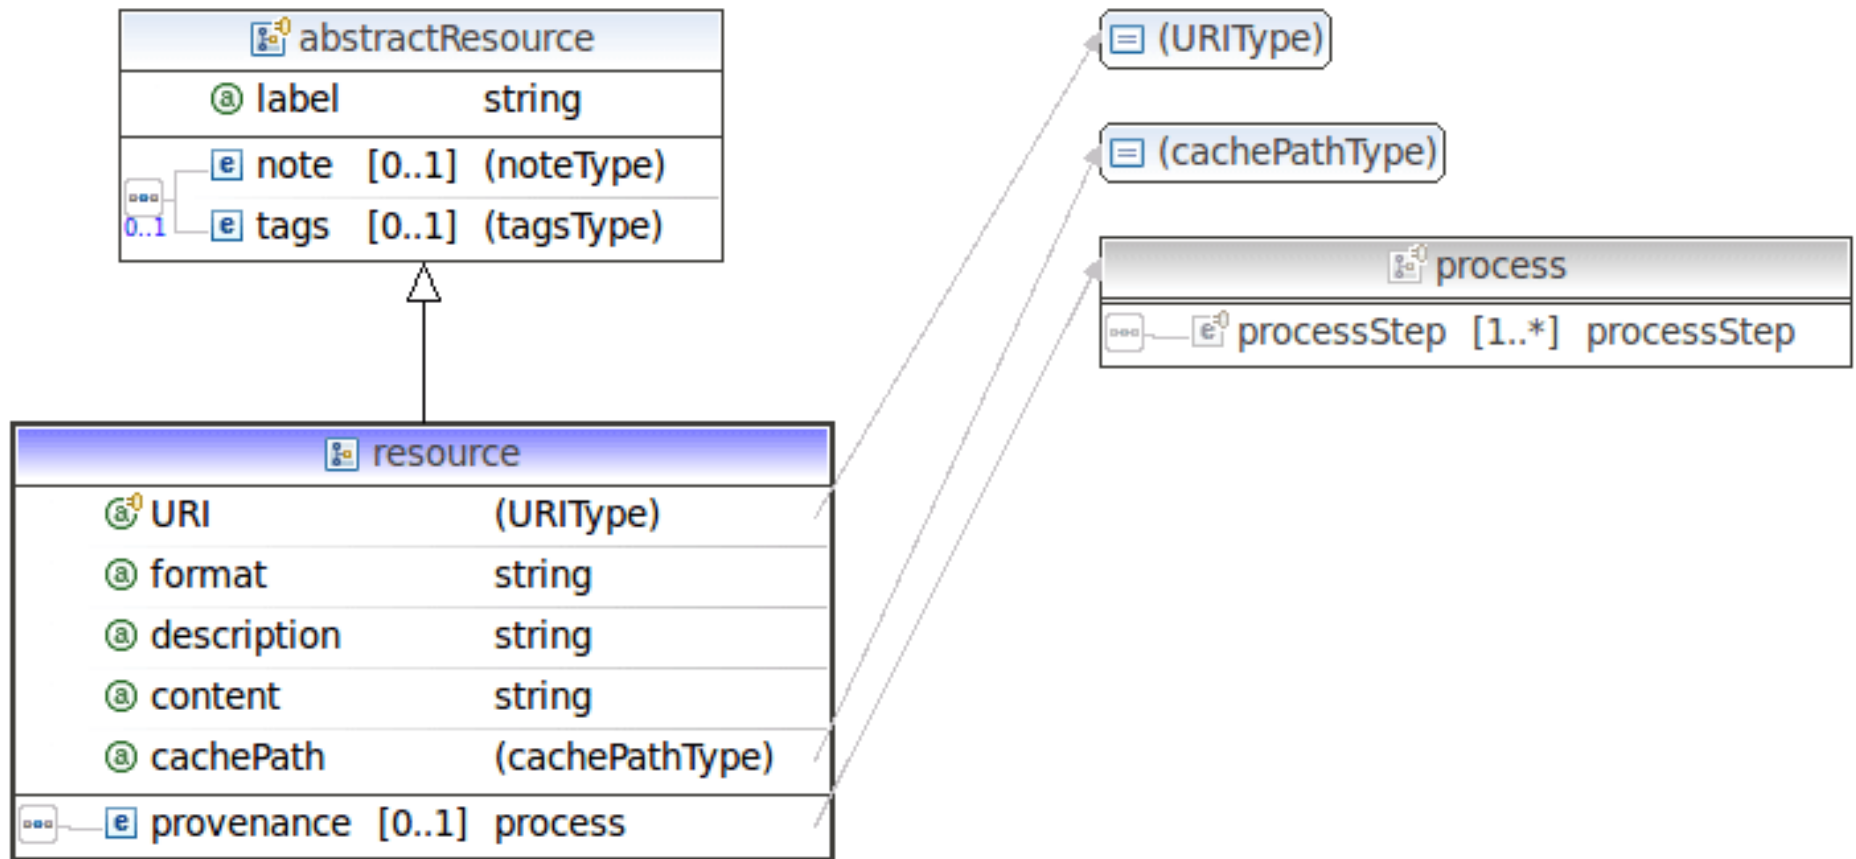

# Demonstration

# XML Graphical Design Tools

- Eclipse IDE
  - By Eclipse, <http://www.eclipse.org/downloads>
  - Java or Java EE Developers version
  - Free
- XMLSpy
  - By Altova, <http://www.altova.com>
  - Professional or Enterprise Edition
  - Licensed
- Oxygen
  - By <oxygen/>, <http://www.oxygenxml.com>
  - XML Editor
  - Licensed

# Unbounded Elements

- Avoid unbounded elements
- Use `<appinfo>` element to set unique identifier
- Wrap in parent element of `maxoccurs=1`

# <appinfo>

```
<xs:element name="fields" minOccurs="0">
  <xs:complexType>
    <xs:sequence minOccurs="0">
      <xs:element name="field" minOccurs="0" maxOccurs="unbounded">
        <xs:annotation>
          <xs:appinfo>
            <xdat:field>
              <xdat:relation uniqueComposite="NAME"/>
            </xdat:field>
          </xs:appinfo>
        </xs:annotation>
        <xs:complexType>
          <xs:simpleContent>
            <xs:extension base="xs:string">
              <xs:attribute name="name" type="xs:string">
                <xs:annotation>
                  <xs:appinfo>
                    <xdat:field uniqueComposite="NAME"/>
                  </xs:appinfo>
                </xs:annotation>
              </xs:attribute>
            </xs:extension>
          </xs:simpleContent>
        </xs:complexType>
      </xs:element>
    </xs:sequence>
  </xs:complexType>
</xs:element>
```

# Unbounded Elements

- Avoid unbounded elements
- Use `<appinfo>` element to set unique identifier
- Wrap in parent element of `maxoccurs=1`

# XNAT Schema Best Practices Summary

- ❖ Keep names short
- ❖ Limit unbounded elements
- ❖ Use annotation tags to specify unique field(s) for database entries
- ❖ Wrap unbounded elements in a parent element with a maxoccurs = 1
- ❖ Limit enumerations
- ❖ Use namespace prefix for directory, filename, and prefix.

# Enable New Schemas in XNAT

projects/xnat/InstanceSettings.xml

  <schema>_<datatype>.xml
```

# Check Logs

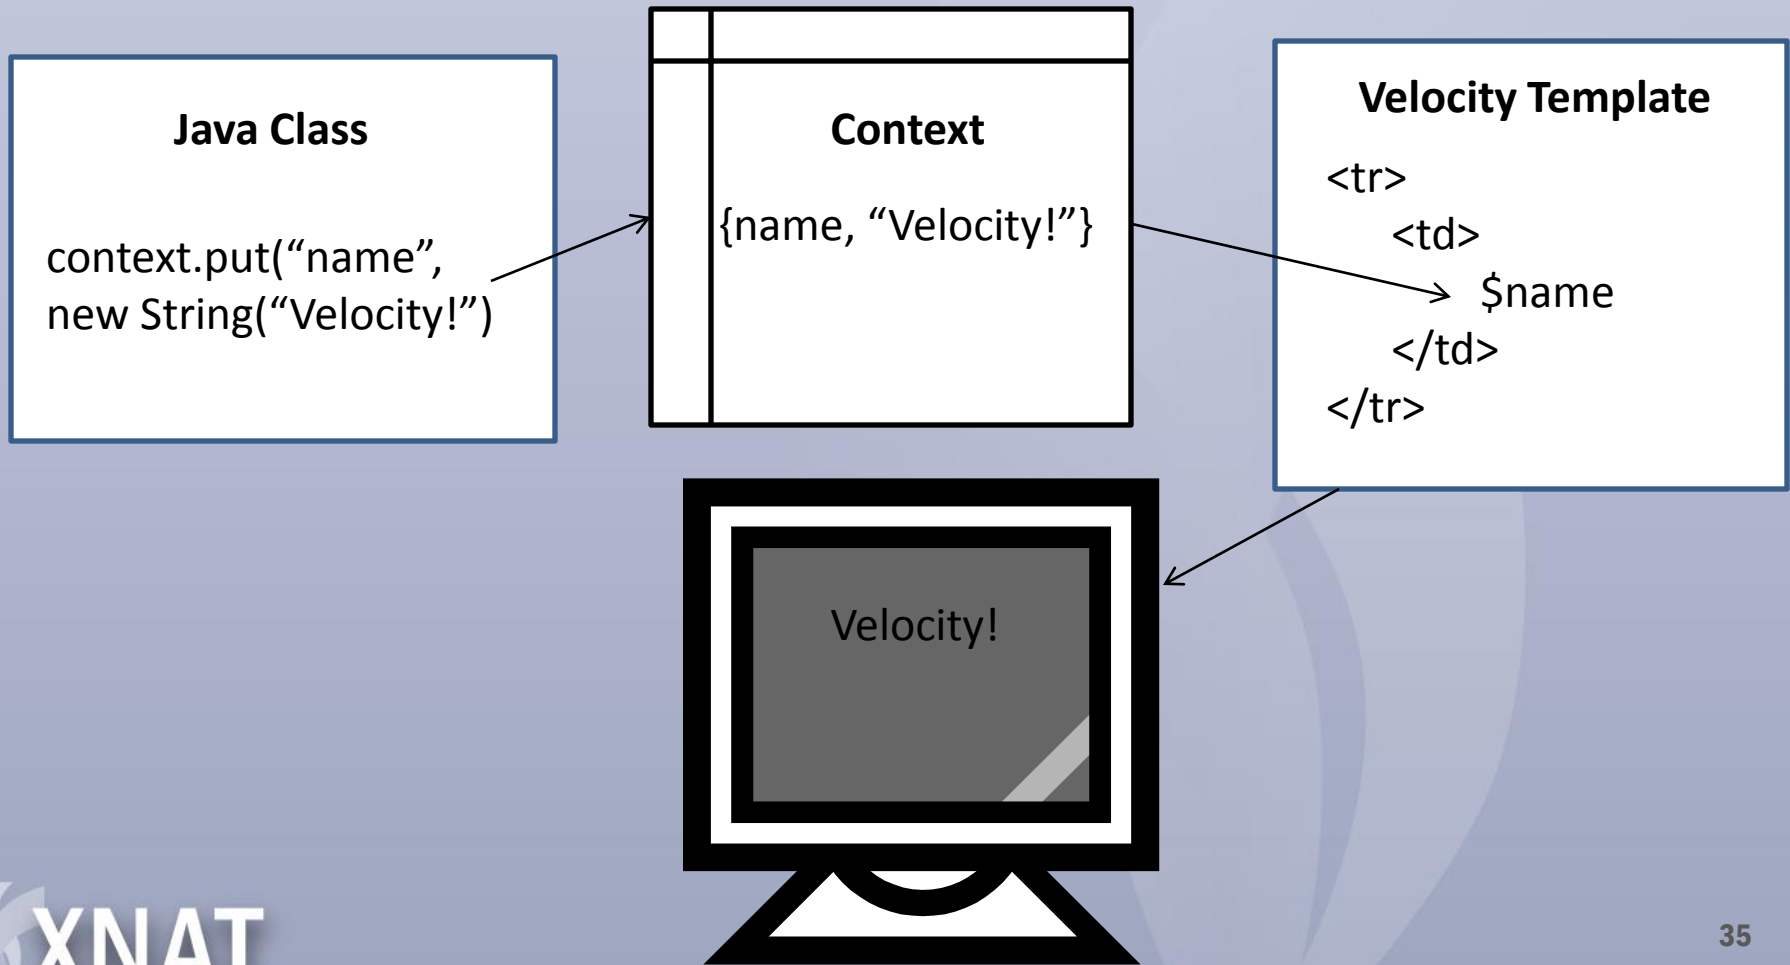

- `<tomcat dir>/xnat/logs/turbine.log`

# Apache Turbine and Velocity

- XNAT Uses Apache Turbine Web Application Framework
- Uses Model-View-Controller (MVC) model, similar to Struts or PHP
- Velocity templates (.vm files) contain normally contain a mix of HTML, JavaScript, and Velocity Template Language (VTL)

# Velocity Overview

- Data Objects are stored to and retrieved from the context

# Velocity Overview

- Velocity Template Language Syntax
  - Variable reference `$`
  - Comments `##`
  - Arithmetic Operators `+, -, *, /, %`
  - Relational `== ##` not just equivalency, can be used to compare objects
  - Logic Operators `&&, ||, !`
  - Range Operator `[n..m]`
  - Escape Character `\`

# Velocity Overview

- Velocity Template Language Syntax

- Assign a value to a variable

```
#set( $foo = "Velocity" )
```

```
#set( $foo = 6)
```

- Reference a variable

```
$foo
```

or

```
$!foo ## if value is null, print nothing
```

# Velocity Overview

- Velocity Template Language Syntax

- Reference a method

`$customer.getAddress()`

`$customer.getAddress("current")`

- Index notation

`$foo[0]`    ## `$foo` takes in an Integer look up to an ArrayList

# Velocity Overview

- Velocity Template Language Syntax

- if/elseif/else

example 1: single argument

```
#if( $foo ) <strong>Velocity!</strong> #end
```

example 2: relational operator

```
#if($name=="apples") apples  
  #elseif ($name=="oranges") oranges  
  #else bananas  
#end
```

# Velocity Overview

- Velocity Template Language Syntax

- loops

```
#foreach( $criterion in $criteria )
```

```
    Current value: $!criterion
```

```
#end
```

```
#foreach( $i in [n..m])
```

```
    Name $i: $criterion.getName($i)
```

```
#end
```

# Velocimacros

```
#macro (formXDATCheckBox $label $field $value)
  <td bgcolor="$ui.formFieldColor">
    <input type="checkbox" name="$field" value="true"
      #if ($value) checked #end />
    <b>
      $label
    </b>
  </td>
#end
```

- Velocimacros provide ways to repeat segments of text
- XNAT provides a library of macros already available from:  
[plugin-resources/webapp/xdat-templates/macros/TurbineMacros.vm](http://plugin-resources/webapp/xdat-templates/macros/TurbineMacros.vm)

# Velocity Overview

- Velocity Template Language Syntax
  - Parse
    - Allows the template designer to import a local file that contains Velocity Template Language (VTL)
    - Velocity will parse the VTL and render the template specified

```
#parse( "parsefoo.vm" )
```

# Site Description Customization

```
<tr>  
  <td valign="top" colspan="2">  
    #parse("/screens/site_description.vm")  
  </td>  
</tr>
```

# Adding Analytics Code

- A good place to add analytics code is in `projects/xnat/src/templates/navigations/DefaultBottom.vm`
- Occurs on almost every page (except login)

# XNAT Data Objects in the Context

- \$turbineUtils
  - XDAT Core library containing various utilities
  - In particular,

`$turbineUtils.getTemplateName (String module, String dataType, String project)`

is used quite frequently to enable customization by project

Many other useful methods in TurbineUtils such as:

`formatDate(date, pattern)`

`getArrayIndex(Object[],int)`

# Project Specific Customization

```
#parse( $turbineUtils.getTemplateName(  
"_report",  
$om.getXSIType(),  
$project))
```

XNAT will first look in:

```
projects/xnat/src/templates/screens/<schema>_<datatype>  
/<schema>_<datatype>_<project>.vm
```

If not found, XNAT will try:

```
projects/xnat/src/templates/screens/<schema>_<datatype>  
/<schema>_<datatype>.vm
```

# XNAT Data Objects in the Context

- \$om
  - Object inserted by default into the context
  - Provides getter and setter methods for all elements in the child and parent objects
  - A corresponding Java class (automatically generated) can be further edited

projects/xnat/src/java/org/nrg/xdat/om/base/auto/  
Auto<schema><datatype>.java

# Demonstration

# Deploying the Updated Templates

- Create new copies of the XDATScreen\*.vm files in the projects directory.
  - From: `projects/xnat/src/base-templates/screens`
  - To: `projects/xnat/src/templates/screens`
- Customize \*.vm files
- Run `bin/quick-deploy-templates.sh` to deploy the templates to Tomcat. (No restart necessary).

# Placing Your Own Objects in the Context

- Create auto-generated Java code
  - From: `projects/xnat/src/java/org/nrg/xdat/turbine/modules/screens`
  - To: `projects/xnat/src/java/org/apache/turbine/app/xnat/modules/screens`
- Customize the Java file: `context.put("name", object)`
- If you're using an IDE run:  
`bin/quick-deploy.sh -Dclass.dir=<class dir>`  
Tomcat restart required for Java

# Adding Action Classes

- Action classes are not auto-generated, but can be added
- Create action Java files in:  
`projects/xnat/src/java/org/apache/turbine/app/  
xnat/modules/actions`

# Demonstration

# XNAT Display Documents

- Auto-generated and located in:  
`projects/xnat/src/schemas/<schema>/  
display/<schema>_<datatype>.xml`
- Customize the files in place, no need to move
- Run: `bin/quick-deploy-templates.sh`
- Reload Display Documents on the Administer page

3	/@WEBAF	SAIS_004	SAIS_004		male		131		

# <DisplayField>

```
<DisplayField id="EXPT_ID" header="ID" visible="true" searchable="true">
  <DisplayFieldElement name="Field1" schema-element="iq:iqAssessmentData.ID"/>
  <HTML-Link>
    <Property name="HREF" value="none"/>
    <Property name="ONCLICK" value="return rpt('@Field1','iq:iqAssessmentData','iq:iqAssessmentData.ID');">
      <InsertValue id="Field1" field="EXPT_ID"/>
    </Property>
  </HTML-Link>
</DisplayField>
```

- Define element you may see in a listing or search
- Must be defined to be included in the Add Columns list
- Element can be defined as text or link

# <DisplayVersion>

```
<DisplayVersion versionName="listing" default-order-by="DATE" default-sort-order="DESC" brief-description="IQAssessment" dark-c
  <DisplayFieldRef id="RPT"/>
  <DisplayFieldRef id="LABEL"/>
  <DisplayFieldRef id="SUBJECT_LABEL" element_name="xnat:subjectData"/>
  <DisplayFieldRef id="DATE"/>
  <DisplayFieldRef id="GENDER" element_name="xnat:subjectData"/>
  <DisplayFieldRef id="AGE"/>
  <DisplayFieldRef id="FSIQ"/>
  <DisplayFieldRef id="VERBALIQ"/>
  <DisplayFieldRef id="PERFORMANCEIQ"/>
</DisplayVersion>
```

- Groups DisplayFields into listing by ID
- Some default listings:
  - listing
  - listing\_csv
  - brief
  - detailed
  - project bundle

# <SQLView>

```
<SQLView name="IQ_IQASSESSMENTDATA_PROJECTS"  
sql="SELECT id, '&lt;' || expt.project || '&gt;' || xs_a_concat(', ' || shared.project)  
AS projects FROM xnat_experimentData expt LEFT JOIN xnat_experimentData_share shared  
ON expt.id=shared.sharing_share_xnat_experimentda_id LEFT JOIN xdat_meta_element xme  
ON expt.extension = xme.xdat_meta_element_id WHERE element_name='iq:iqAssessmentData'  
GROUP BY expt.id,expt.project"/>
```

```
<DisplayField header="Projects" id="PROJECTS" data-type="string">  
  <DisplayFieldElement name="Field1" viewName="IQ_IQASSESSMENTDATA_PROJECTS" viewColumn="PROJECTS"/>  
</DisplayField>
```

```
<ViewLink alias="IQ_IQASSESSMENTDATA_PROJECTS">  
  <Mapping TableName="IQ_IQASSESSMENTDATA_PROJECTS">  
    <MappingColumn rootElement="iq:iqAssessmentData" fieldElement="iq:iqAssessmentData.ID" mapsTo="id"/>  
  </Mapping>  
</ViewLink>
```

- Way to display unbounded elements in listings
- Allows just about any SQL command: concatenate text, do math operations

# <Arc-Definition> and <Arc>

```
<Arc-Definition Id="PARTICIPANT_EXPERIMENT">
  <CommonField id="DATE" type="DATE"/>
  <CommonField id="PART_ID" type="STRING"/>
  <CommonField id="EXPT_ID" type="STRING"/>
  <Bridge-Element name="xnat:subjectData" field="SUBJECT_ID"/>
  <Filter field="EXPT_ID" filterType="distinct"/>
  <Filter field="DATE" filterType="closest"/>
  <Filter field="PART_ID" filterType="equals"/>
</Arc-Definition>
```

```
<Arc name="PARTICIPANT_EXPERIMENT">
  <CommonField id="PART_ID" local-field="SUBJECT_ID"/>
  <CommonField id="DATE" local-field="MR_DATE"/>
  <CommonField id="EXPT_ID" local-field="EXPT_ID"/>
</Arc>
```

- Allows joins between displayVersions
- Arc-Definition is only defined once
- Every member element must include an ARC and is expected to include all CommonFields

# <SchemaLink>

```
<SchemaLink element="xnat:visitData" type="mapping" alias="xnat:visitData">
  <Mapping tableName="SUBJECT_VISIT_DISTINCT">
    <MappingColumn rootElement="xnat:subjectType" fieldElement="xnat:subjectType.xnat_subjecttype_id" mapsTo="xnat_subjecttype_id"/>
    <MappingColumn rootElement="xnat:visitData" fieldElement="xnat:visitData.id" mapsTo="xnat_visitdata_id"/>
  </Mapping>
</SchemaLink>
```

- Allows developer to include fields from another Schema Element
- Element can then be used in <DisplayField> elements as if it is the displayable element

# Additional Customizations Notes

- Thanks to those who have already provided additional customizations
- XNAT customizations are being cataloged and will be made available as soon as possible at <http://www.xnat.org/Customizing+XNAT>
- Many types of customizations we didn't see today
  - Pipelines
  - Many more data types
  - Many more GUI customizations
- Request for customizations: [gurneyj@wustl.edu](mailto:gurneyj@wustl.edu)
