

Pipeline Processing Settings in XNAT

You may wish to use a URL different than the site URL when running pipelines. This can be configured from the Pipeline Settings tab within the Admin UI. Go to **Administer > Site Administration** and select the **Pipeline Settings** tab.

Pipeline Settings

Processing Url

The address to be used for processing. If this is left blank, pipelines will use the site URL. If your pipelines need to connect to an internal URL, different from your external site URL, provide one here.

Pipeline Settings

Setting	Property Name	Description
Processing Url	processing Url	Whatever you enter here will be passed into pipelines as the -host command line argument. If you do not enter a processing URL, the site URL will be used for processing pipelines. Any changes to this setting take effect immediately and all future pipelines will be launched with the updated command line argument.

Site-wide config properties can be accessed via REST at `/xapi/siteConfig/values/{property-name}`.

Site-wide config properties can be access programmatically in Velocity via `$siteConfig.{property-name}`.
