Check The Status Of An Upload

After initializing an asynchronous image session upload, you can get a report on the status of that upload, as long as you know the temporary upload ID. This ID is generated by the `org.nrg.xnat.ajax.UploadProgress` java class, and is not easily accessible outside the codebase. Typically, these URLs are only used in code. A series of responses is returned as the upload process progresses.

```
GET - /data/status/{Upload_ID}
```

Parameters

{Upload_ID}	Required path parameter.
format	Optional querystring parameter. Specifies the output format. If no format is specified, plain text is returned <ul style="list-style-type: none">• json• html

Response (JSON format shown)

```
{
  "msgs": [
    [
      {
        "msg": "Importing file (0000012.zip)",
        "status": "PROCESSING"
      }
    ]
  ]
}
```

Reset The Status Of An Upload

This is performed prior to initiating an image session import process. It has no effect once the upload completes.

```
GET - /servlet/AjaxServlet?remote-class=org.nrg.xnat.ajax.UploadProgress&remote-method=start&ID={Upload_ID}
```

Parameters

remote-class	Required querystring parameter. Must be set to org.nrg.xnat.ajax.UploadProgress
remote-method	Required querystring parameter. Must be set to start
{Upload_ID}	Required querystring parameter.
