

How to Create Subjects with XNAT REST API

Creating subjects via the XNAT REST API is simple. Performing a PUT to the following URI would create a subject. (This would create a subject called '1' within a project with the ID 'TEST')

```
/data/archive/projects/TEST/subjects/1
```

 The TEST project must exist before this command will succeed.

You can also assign demographics to this subject using the XML PATH shortcuts defined here : [XNAT REST XML Path Shortcuts](#)

To assign the gender and handedness to this subject, you would execute the following PUT.

```
/data/archive/projects/TEST/subjects/1?gender=male&handedness=left
```
